- 1.1 ADC Infrastructure Limited were commissioned by Robert Doughty Consultancy (RDC) on behalf of South Holland District Council (SHDC) to produce this Transport Technical Note in support of the review of the Local Development Order (LDO) for the Food Enterprise Zone (FEZ) in Holbeach.
- 1.2 The FEZ provides new growth and investment in food, farming and Agri-technologies and is located on land west of the A151 and on the western edge of Holbeach, as shown in **Figure 1**.

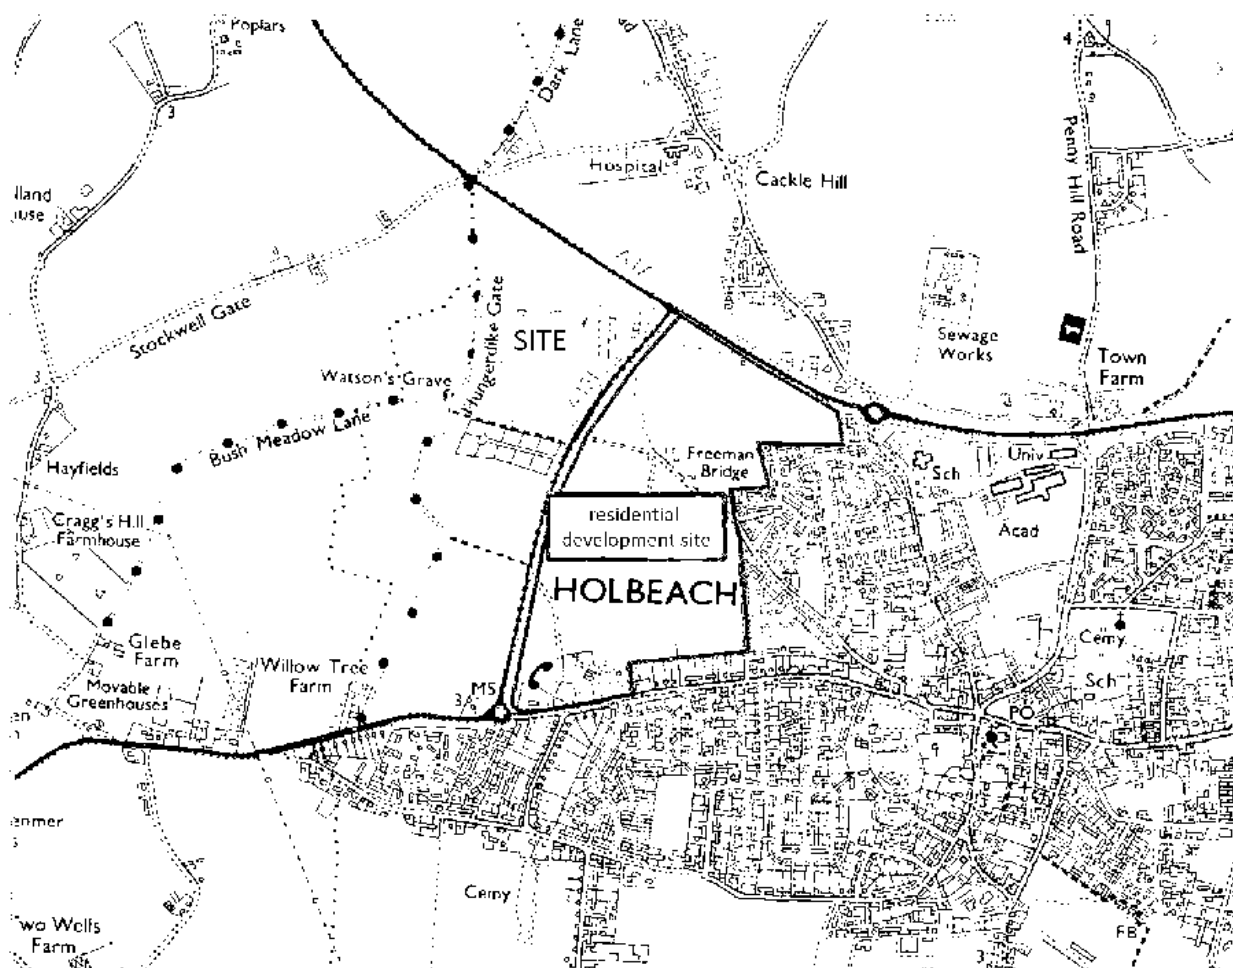

Figure 1: General site location

- 1.3 ADC Infrastructure Limited produced a Transport Technical Note¹ in August 2016. This was produced in support of the initial LDO for the scheme which was adopted by SHDC in 2018. The LDO is valid for a five-year period and therefore is due to expire in 2023.
- 1.4 Since the adoption of the LDO, construction has begun and at the time of writing this report, the National Centre for Food Manufacturing has been constructed and is occupied by the University of Lincoln. In addition, 'The Hub' has also been constructed which is a business enterprise centre for small to medium companies across the agri-tech sector and has 25 self-contained office as well as eight self-contained workshops.
- 1.5 Construction of the full site will not be complete by the time the LDO lapses. Therefore, SHDC wish to review the LDO with the view of extending the LDO.

¹ ADC Infrastructure Transport Technical Note, 3 August 2016

- 1.6 The Technical Note produced in August 2016 listed the development scenarios that could be promoted for the FEZ and the potential highway impacts of the respective scenarios on the local highway network.
- 1.7 At the time of writing the highway network was proposed to be changed by the Peppermint Junction improvement scheme. This scheme proposed to replace the A17/A151 priority-controlled ghost island junction with a three-arm roundabout and a new four-arm priority controlled roundabout which would serve the site as well as a consented residential development (application reference: H09-0468-16) to the east of the A151 as highlighted in green in **Figure 1**. Both junctions have now been constructed and are in use.
- 1.8 This report has therefore been produced to update the findings of the August 2016 Technical Note to assist the review of the LDO with particular focus on the ability of the adjacent highway network to accommodate the proposed development traffic once the site is fully operational.

- 2.1 As stated in Section 1, the site is currently under construction and the National Centre for Food Manufacturing and 'The Hub' are complete and in use. In addition, based on a site visit of the site undertaken in February 2023, an additional unit is also under construction.

Figure 2: Unit currently under construction

- 2.2 As per the previous Technical Note produced in August 2016, the study area for this report consists of the following junctions which are also highlighted in **Figure 3**.
- 1) A151 / site access priority-controlled roundabout
 - 2) A151 / Frontier Agriculture / Sam Crop Sprayers priority-controlled T-junction
 - 3) A17 / A151 priority-controlled roundabout

Figure 3: Study area

- 2.3 As shown in **Figure 4** below, there are two notable committed developments in the vicinity to the site which have been included within the assessments within this Technical Note.

Figure 4: Nearby developments

- 2.4 To the east of the site, a planning application (application reference: H09-0468-16) for up to 1,000 dwellings was submitted in May 2016. The masterplan for the development is shown in **Figure 5** below and indicates the new A151 / site access roundabout would be used to serve the western part of the development. There would also be an access point at the southern end of the development from Spalding Road. The outline application is yet to be decided.
- 2.5 However, a separate planning application (application reference: H09-0602-20) for the portion of land highlighted in orange was submitted in July 2020 for the construction of 103 residential dwellings. This development is accessed via extension of Cedar Drive and Oakwood Glade. The

application was approved by SHDC in December 2021 and construction of the development has commenced.

Figure 5: Masterplan for Holbeach West residential development

2.6 To the south of the site, an outline planning application (application reference: H09-0521-14) for up to 900 residential dwellings as well as a primary school. The application was approved by SHDC in December 2016. As shown in **Figure 6**, a new priority-controlled roundabout has been constructed on Hall Gate to the north west of the development as well as a priority-controlled T-junction on Fen Road to the south east. Construction of the development has commenced and some of the houses are occupied.

Figure 6: Masterplan for Hall Gate development

- 2.7 To obtain traffic flow data of the study area junctions, manual traffic counts were undertaken on Tuesday 17 January 2023. The traffic counts are contained in **Appendix A**. The observed morning and evening peak hour traffic flows are shown in **Diagram 1**.
- 2.8 It is necessary to examine the accident record in the study area to identify any trends that may be made worse by the additional traffic and person trips generated by the proposed development. Therefore, the most recent five-years personal injury accident (PIA) data for the period between 1 January 2017 and 31 December 2022 was obtained from LCC and is shown in **Appendix B**. As shown in **Figure 7**, a total of five accidents have occurred within the study period, all of which were slight in nature.

Figure 7: Location of recorded accidents within study area

2.9 Regarding the A151 / site access priority-controlled roundabout, one accident (reference: 220727746) occurred during the study period. The accident in foggy conditions and involved a car travelling north on the A151 towards the roundabout and skidded on ice whilst braking which caused the vehicle to collide with a goods vehicle (7.5 tonnes and over).

2.10 The remaining four accidents occurred at the A17 / A151 priority-controlled roundabout and are described below:

- 200046596 – a car which was travelling west to east on the A17 skidded and overturned at the circulatory carriageway of the roundabout. It was deemed the driver of the car was impaired by alcohol.
- 200363352 – a goods vehicle (3.5 tonnes and under) was travelling south on the A17 with intentions of turning right onto the A151. The driver of the goods vehicle changed lanes to make the right turn manoeuvre but in doing so, collided with a motorcyclist who was travelling straight ahead. It was deemed the driver of the goods vehicle failed to look properly before changing lanes.
- 210756915 – a motorcyclist travelling north on the A17 had to take sudden action to avoid a collision with a car that swerved across lanes. In taking evasive action, the motorcyclist collided with a road sign.
- 220184006 – a goods vehicle (unknown weight) was travelling east to west on the A17 and whilst on the circulatory carriageway, due to a gust of wind, the trailer of the lorry tipped over onto its side.

2.11 In summary, the location and cause of the recorded accidents do not indicate an apparent trend. Hence, it is concluded that there is not an accident problem at the study area junctions.

- 3.1 The development proposals consist of a new education/employment site to the west of the A151. The development will allow new growth and investment in food, farming and agri-technologies. Construction has begun and at the time of writing this report, the National Centre for Food Manufacturing has been constructed and is occupied by the University of Lincoln. In addition, 'The Hub' has also been constructed which is a business enterprise centre for small to medium companies across the agri-tech sector.
- 3.2 The breakdown of the floor areas set out in the adopted LDO are shown in **Figure 8** below.

The Floor Areas set out in the adopted LDO were

B1 (now E)(g)}	20,000 sq m (800 delivered 334 under consideration)
B2	20,000 sq m (1,800 delivered with 1421 under consideration)
D1 (F1) education	9,500 sq m (1818 delivered)
D2 (F1) Conference facilities	1500 sq m (none delivered)
A2 financial and professional	1500 (none delivered)

Figure 8: Floor areas for proposed development

- 3.3 This equates to 20,000sqm for B1 (now Class E (g)) use, 20,000sqm for B2 use, and 9,500sqm for education (D1) use. In addition, there would be up to 1,500sqm use associated with conference facilities and 1,500sqm use associated with financial and professional services.

- 4.1 To determine the traffic of the proposed Class E (g) use, reference was made to the TRICS database version 7.9.4. All sites in England (excluding London) in the ‘Employment – Office’ category were selected. Sites up to 50,000sqm were examined in suburban, edge of town centre, and edge of town locations. All weekend surveys were de-selected. The TRICS outputs are contained in **Appendix C** and the average trip rates of the surveyed sites as well as the resultant traffic generation are shown in the table below.

traffic generation - Class E (g) (iii) (formerly part of B1c)		arrive	depart	two-way
trip rates (per 100sqm)	AM peak hour	1.346	0.153	1.499
	PM peak hour	0.124	1.224	1.348
vehicle trips (20,000sqm)	AM peak hour	269	31	300
	PM peak hour	25	245	270

- 4.2 The TRICS database was examined to determine the traffic generation of the proposed B2 use. All sites in England (excluding London) in the ‘Employment – industrial estate’ category with a minimum split of 70% for general industrial were selected. Sites up to 30,000sqm were examined in suburban, edge of town centre, edge of town locations. All weekend surveys were de-selected. The TRICS outputs are contained in **Appendix D** and the average trip rates of the surveyed sites as well as the resultant traffic generation are shown in the table below.

traffic generation – B2		arrive	depart	two-way
trip rates (per 100sqm)	AM peak hour	0.457	0.190	0.647
	PM peak hour	0.112	0.479	0.591
vehicle trips (20,000sqm)	AM peak hour	91	38	129
	PM peak hour	22	96	118

- 4.3 With regards to the composition of the traffic for the B2 use, it is reasonable to assume that the typical peak hour HGV proportion for a B2 site is around 10% of the total traffic generated. The remaining light vehicles are assumed to be staff, visitors and LGV deliveries. The resulting split between light and HGV vehicles is shown in the table below.

vehicle trip split		arrive	depart	two-way
AM peak hour	Light vehicles (90%)	82	34	116
	HGVs (10%)	9	4	13
PM peak hour	Light vehicles (90%)	20	86	106
	HGVs (10%)	2	10	12

- 4.4 The TRICS database was examined to determine the traffic generation associated with the proposed education use. All sites in England (excluding London) in the ‘Education – College/University’ category were examined in suburban, edge of town centre, edge of town locations. All weekend surveys were de-selected. The TRICS outputs are contained in **Appendix E** and the average trip rates of the surveyed sites as well as the resultant traffic generation are shown in the table below.

traffic generation – Education (F1)		arrive	depart	two-way
trip rates (per 100sqm)	AM peak hour	1.178	0.342	1.520
	PM peak hour	0.234	0.649	0.883
vehicle trips (9,500sqm)	AM peak hour	112	32	144
	PM peak hour	22	62	84

4.5 The TRICS database was examined to determine the traffic generation associated with the proposed conference as well as financial and professional uses. However, the TRICS database does not provide sites that are comparable to these uses. Therefore, it is considered reasonable to assess the trips associated with the uses based on trip rates for office use as outlined in the table at paragraph 4.1. Therefore, based on the office trip rates, the resultant traffic generation for the conference as well as financial and professional uses is shown in the table below.

traffic generation – Conference + Financial and Professional		arrive	depart	two-way
trip rates (per 100sqm)	AM peak hour	1.346	0.153	1.499
	PM peak hour	0.124	1.224	1.348
vehicle trips (3,000sqm)	AM peak hour	40	5	45
	PM peak hour	4	37	41

4.6 When combining the respective uses summarised above, the overall trip generation for the proposed development is shown in the table below. As shown, in the morning peak hour, there would be 618 two-way vehicular trips and 513 two-way vehicular trips in the evening peak hour.

traffic generation – Overall trips		arrive	depart	two-way
vehicle trips (52,500sqm)	AM peak hour	513	105	618
	PM peak hour	73	440	513

- 5.1 To determine the distribution pattern of the proposed employment development, reference was made to the 2011 National Census 'Location of usual residence and place of work by method of travel to work' dataset (reference: WU03EW). The data provides information on the in moves and out moves to and from the middle super output layer (MSOA) associated with journeys to work.
- 5.2 The development is located in the 'South Holland 003' MSOA. Therefore, the data for the South Holland 007 MSOA was examined to identify where people working in MSOA, who travel by car, travel from. This approach is appropriate given that it is likely that new employees within the development will display similar travel patterns to existing employees in the South Holland 007 MSOA. From this information, the travel route was estimated using Google Maps, and the proportion using each highway route was identified. A copy of the Census data is contained in **Appendix F** and the trip distribution pattern is summarised in **Figure 9** below and in **Diagram 2**.

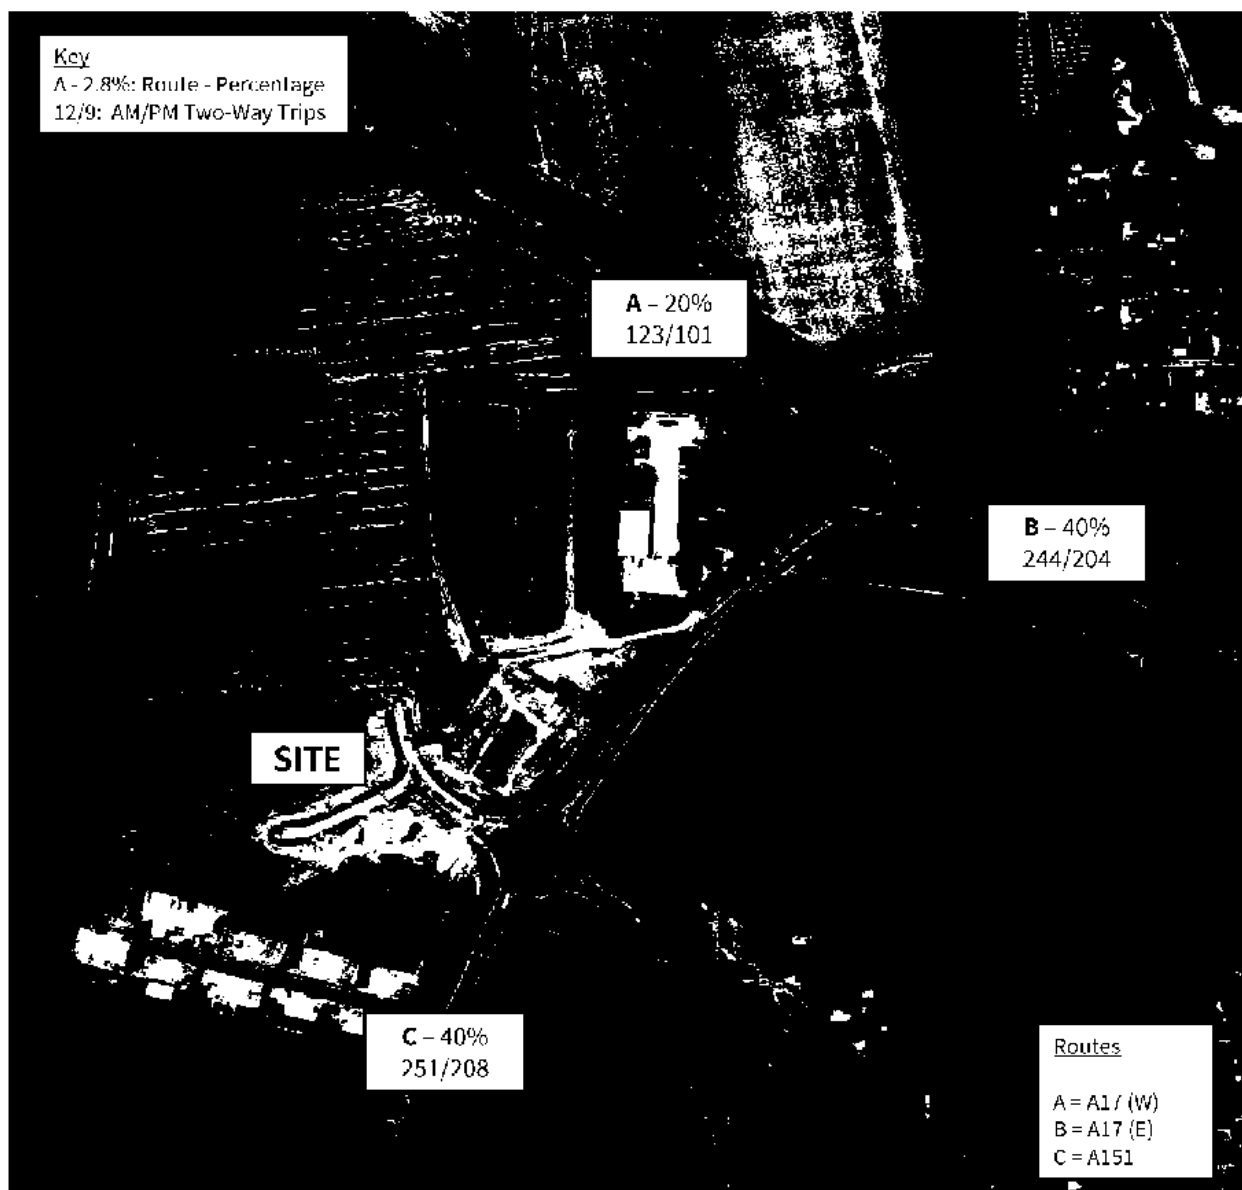

Figure 9: Trip distribution pattern and assignment of development traffic

- 5.3 As shown above, the traffic will divide at the site access with the A151, with 40% routing to/from the south along the A151 towards the A151 Spalding Road which extends to Holbeach to the east and the A16 and Spalding to the west. The remaining 60% would to/from the north towards the

junction with the A17. The traffic will split further at this junction with 20% routing to/from the north west towards the A52 whilst the remaining 40% routing to/from the south east towards the A1101, A47 and Kings Lynn.

- 5.4 The overall development traffic (table at paragraph 4.5) was assigned to the local highway network in accordance with the distribution pattern and the resultant morning and evening development traffic assignment is summarised in **Figure 9** and contained in **Diagram 3**. In a peak hour, there would be up to 251 two-way vehicular trips travelling to and from the south of the site whilst there would be up to 367 two-way vehicular trips travelling to and from the north which would split at the A17/A151 roundabout. In the worst case morning peak hour, 123 two-way trips route to/from the north east whilst the remaining 244 would route to/from the south east.
- 5.5 As stated in Section 2, the site is currently in use and, therefore, generated traffic movements. Based on the information provided, 4,418sqm of floorspace has been delivered. Taking into account the trip rates summarised in Section 4, this equates to 49 two-way vehicular traffic movements in the morning peak hour and 37 two-way trips in the evening peak hour. These trips should already be on the local highway network and, hence, can be discounted from the development traffic assignment traffic flows. However, to be robust, the traffic generated by the overall development has been assessed.

- 6.1 As stated in Section 2, manual traffic counts were undertaken at the study area junctions on Tuesday 17 January 2023. The observed morning and evening peak hour traffic flows are shown in **Diagram 1**.
- 6.2 The LDO takes effect on the date it is adopted by SHDC and will be valid for five years. Hence, on the basis the extension of the LDO is adopted by SHDC this year, that would mean it would be due to expire in 2028. Hence, an assessment year of 2028 has been adopted for the capacity assessment of the study area junctions.
- 6.3 In addition, the site has been promoted as an employment allocation in the South East Lincolnshire Local Plan which was adopted in March 2019 and extends to 2036. Hence, an assessment year of 2036 has also been adopted.
- 6.4 The observed traffic flows were therefore growthed to 2028 and 2036 levels using TEMPRO (version 7.2b, dataset 72), which includes links to the National Traffic Model. The TEMPRO output is in **Appendix G** and shows the growth rates for 'all roads' within the South Holland 003 MSOA as follows:
- 2023 to 2028 AM 1.0605
 - 2023 to 2028 PM 1.0613
 - 2023 to 2036 AM 1.1373
 - 2023 to 2036 PM 1.1401
- The resultant 2028 and 2036 Base traffic flows are contained in **Diagrams 4 and 5** respectively.
- 6.5 In addition to background growth, it is necessary to include traffic flows associated with any committed developments within the 2028 and 2036 assessment year traffic flows. The Government's planning practice guidance states "*It is important to give appropriate considerations to cumulative impacts arising from other committed developments (i.e. development that is consented or allocated where there is a reasonable degree of certainty it will proceed within the next three years)*".
- 6.6 As stated in Section 2, there are two notable developments in the vicinity of the site. Traffic flows have therefore been extracted from the respective Transport Assessments.
- 6.7 To the east of the site, a planning application (application reference: H09-0468-16) for up to 1,000 dwellings was submitted in May 2016. The outline application is yet to be decided. However, a separate planning application (application reference: H09-0602-20) for the portion of land highlighted in orange was submitted in July 2020 for the construction of 103 residential dwellings. The application was approved by SHDC in December 2021 and construction of the development has commenced. The traffic flows at the study area junctions associated with the scheme is shown in **Diagram 6**.
- 6.8 To the south of the site, an outline planning application (application reference: H09-0521-14) for up to 900 residential dwellings as well as a primary school. The application was approved by SHDC in December 2016. Construction of the development has commenced and some of the

houses are occupied. Therefore, given there are houses that are occupied, some of the trips associated with the development is already on the local highway network. However, to be robust, the traffic generated by the overall development has been assessed. The traffic flows at the study area junctions associated with the scheme is shown in **Diagram 7**.

- 6.9 The total committed development flows is shown in **Diagram 8** and were added to the 2028 Base traffic flows to produce the 2028 Background traffic flows which is shown in **Diagram 9**. For the 2036 scenario, the total committed development flows were added to the 2036 Base traffic flows to produce the 2036 Background traffic flows which is shown in **Diagram 10**.
- 6.10 The proposed development flows shown in **Diagram 3** were added to the 2028 Background flows to give the 2028 With Development traffic flows which is contained in **Diagram 11**.
- 6.11 For the 2036 scenario, the proposed development flows were added to the 2036 Background flows to give the 2036 With Development traffic flows which is contained in **Diagram 12**.

7.1 The A151 / site access is a four-arm priority-controlled roundabout as shown in **Figure 10**. A model of the roundabout was built using Junctions 9 ARCADY software with junction geometries extracted from OS mapping. The model was tested using the 2023 Observed flows, 2028 and 2036 Base flows, 2028 and 2036 Background flows and 2028 and 2036 With Development flows. The results are summarised in the table below and the ARCADY outputs are in **Appendix H**.

Figure 10: A151 / site access priority-controlled roundabout

- 7.2 As shown in the table above, the junction operates at 32% of capacity in the worst case morning peak hour. In 2028, it is forecast to operate at 34% when taking into account background growth associated with TEMPRO growth factors. With the addition of the traffic related to the committed developments, it is forecast to operate at 43%. With the development in place, the junction is forecast to operate at 67% and, therefore, with spare capacity.
- 7.3 In 2036, it is forecast to operate at 36% when taking into account background growth associated with TEMPRO growth factors. With the addition of the traffic related to the committed developments, it is forecast to operate at 46%. With the development in place, the junction is forecast to operate at 70% and, therefore, with spare capacity.
- 7.4 In Section 2, it was confirmed only one accident occurred at the junction within the study period. Hence, there is no accident problem.
- 7.5 Therefore, the operation of the junction would not be compromised in terms of capacity, congestion, or highway safety as a result of the development and no mitigation measures are proposed.
- 7.6 The A151 / Frontier Agriculture / Sam Crop Sprayers junction is a priority-controlled T-junction as shown in **Figure 11**. A model of the T-junction was built using Junctions 9 PICADY software with junction geometries extracted from OS mapping. The model was tested using the 2023 Observed flows, 2028 and 2036 Base flows, 2028 and 2036 Background flows and 2028 and 2036 With

Development flows. The results are summarised in the table below and the PICADY outputs are in **Appendix I**.

- 7.7 As shown in the table above, the junction performs significantly within capacity with no queuing and minimal delay. With the addition of background growth related to TEMPRO growth factors committed development as well as the proposed development, the junction would still perform with significant spare capacity.
- 7.8 In Section 2, it was confirmed no recorded accidents occurred at the junction within the study period.
- 7.9 Thus, there would be no adverse capacity or safety impacts at the junction because of the development and no mitigation measures are proposed.
- 7.10 The A17 / A151 junction is a three-arm priority-controlled roundabout as shown in **Figure 12**. A model of the roundabout was built using Junctions 9 ARCADY software with junction geometries extracted from OS mapping. The model was tested using the 2023 Observed flows, 2028 and 2036 Base flows, 2028 and 2036 Background flows and 2028 and 2036 With Development flows. The results are summarised in the table below and the ARCADY outputs are in **Appendix J**.

Figure 12: A17 / A151 priority-controlled roundabout

	AM peak hour			PM peak hour

A17 (E)	2.5	6.22	72%	2.0	5.01	67%

- 7.11 As shown in the table above, the junction performs at 49% of capacity in the worst case morning peak hour. In 2028, it is forecast to operate at 52% when taking into account background growth associated with TEMPRO growth factors. With the addition of the traffic related to the committed developments, it is forecast to operate at 56%. With the development in place, the junction is forecast to operate at 68% and, therefore, with spare capacity.
- 7.12 In 2036, it is forecast to operate at 56% when taking into account background growth associated with TEMPRO growth factors. With the addition of the traffic related to the committed developments, it is forecast to operate at 60%. With the development in place, the junction is forecast to operate at 72% and, therefore, with spare capacity.
- 7.13 In Section 2, it was shown that four accidents occurred at the junction within the study period, all of which were slight in nature. It was deemed adverse weather conditions and driver error were key contributors to the accidents. Hence, there is no accident problem at the junction.
- 7.14 Therefore, the operation of the junction would not be compromised in terms of capacity, congestion, or highway safety as a result of the development and no mitigation measures are proposed.

- 8.1 The development proposals consist of a new education/employment site to the west of the A151. Construction has begun and at the time of writing this report, the National Centre for Food Manufacturing has been constructed and is occupied by the University of Lincoln. In addition, 'The Hub' has also been constructed which is a business enterprise centre for small to medium companies across the agri-tech sector. This report has been produced to assist the review of the LDO with particular focus on the ability of the Peppermint Junction improvement scheme to accommodate the proposed development traffic once the site is fully operational.
- 8.2 It was confirmed the development would be a mix of 40% for B1 (now Class E (g)) use, 40% for B2 use, and 20% for education (D1) use. To determine the levels of traffic the various uses would generate, the TRICS database was examined. In total, there would be 560 two-way vehicular trips and 460 two-way vehicular trips in the evening peak hour.
- 8.3 Capacity assessments were undertaken at the A151 / site access and A17 / A151 priority-controlled roundabouts as well as the A151 / Frontier Agriculture priority-controlled T-junction. The capacity assessments demonstrates all three junctions currently perform within capacity. With the addition of background growth related to TEMPRO growth factors and committed developments as well as the traffic generated by the proposed development, the junctions would still continue to operate with spare capacity in the assessment years of 2028 and 2036. Therefore, the additional development traffic can be accommodated on the local road network and no mitigation measures are required as a result of the development.

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
 Actual Range: 5000 to 39230 (units: sqm)
 Range Selected by User: 5000 to 50000 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/10 to 18/01/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	5 days
Tuesday	4 days
Thursday	4 days
Friday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	14 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaken using machines.

Selected Locations:

Edge of Town Centre	8
Suburban Area (PPS6 Out of Centre)	3
Edge of Town	3

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	1
Commercial Zone	5
Residential Zone	2
Built-Up Zone	5
No Sub Category	1

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Inclusion of Servicing Vehicles Counts:

Servicing vehicles Included	1 days - Selected
Servicing vehicles Excluded	13 days - Selected

Secondary Filtering selection:

Use Class:

Not Known	14 days
-----------	---------

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order (England) 2020 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:

All Surveys Included

Population within 500m Range:

All Surveys Included

Population within 1 mile:

5,001 to 10,000	4 days
10,001 to 15,000	1 days
15,001 to 20,000	4 days
25,001 to 50,000	5 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	4 days
75,001 to 100,000	1 days
125,001 to 250,000	5 days
250,001 to 500,000	3 days
500,001 or More	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	2 days
1.1 to 1.5	9 days
1.6 to 2.0	3 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

Yes	8 days
No	6 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	14 days
-----------------	---------

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			5.807			4.790			10.597

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

The survey data, graphs and all associated supporting information, contained within the TRICS Database are published by TRICS Consortium Limited ("the Company") and the Company claims copyright and database rights in this published work. The Company authorises those who possess a current TRICS licence to access the TRICS Database and copy the data contained within the TRICS Database for the licence holders' use only. Parameter summary

Trip rate parameter range selected:	5000 - 39230 (units: sqm)
Survey date date range:	01/01/10 - 18/01/20
Number of weekdays (Monday-Friday):	14
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Parameter summary

Trip rate parameter range selected:	1775 - 18018 (units: sqm)
Survey date date range:	01/01/10 - 18/02/20
Number of weekdays (Monday-Friday):	10
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Calculation Reference: AUDIT-855401-230208-0241

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 04 - EDUCATION
 Category : C - COLLEGE/UNIVERSITY

TOTAL VEHICLESSelected regions and areas:

02 SOUTH EAST		
BU	BUCKINGHAMSHIRE	1 days
ES	EAST SUSSEX	2 days
EX	ESSEX	1 days
KC	KENT	1 days
WS	WEST SUSSEX	2 days
03 SOUTH WEST

PB	PETERBOROUGH	2 days
SF	SUFFOLK	1 days
08 NORTH WEST		
LC	LANCASHIRE	1 days
09 NORTH		
TW	TYNE & WEAR	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
 Actual Range: 5700 to 65000 (units: sqm)
 Range Selected by User: 2435 to 80000 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/10 to 06/01/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Tuesday	7 days
Wednesday	2 days
Thursday	5 days
Friday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	16 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaken using machines.

Selected Locations:

Edge of Town Centre	6
Suburban Area (PPS6 Out of Centre)	8
Edge of Town	1
Neighbourhood Centre (PPS6 Local Centre)	1

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone	10
------------------	----

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Inclusion of Servicing Vehicles Counts:

Servicing vehicles Included	3 days - Selected
Servicing vehicles Excluded	15 days - Selected

Secondary Filtering selection:

Use Class:

F1(a)	16 days
-------	---------

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order (England) 2020 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

5,001 to 10,000	2 days
10,001 to 15,000	2 days
15,001 to 20,000	2 days
20,001 to 25,000	4 days
25,001 to 50,000	6 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	2 days
50,001 to 75,000	2 days
75,001 to 100,000	3 days
100,001 to 125,000	1 days
125,001 to 250,000	8 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	5 days
1.1 to 1.5	11 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

Yes	6 days
No	10 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	16 days
-----------------	---------

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			4.398			4.432			8.830

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

Parameter summary

Trip rate parameter range selected:	5700 - 65000 (units: sqm)
Survey date range:	01/01/10 - 06/01/20
Number of weekdays (Monday-Friday):	16
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	2
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	A151 - site access	Standard Roundabout		1, 2, 3, 4	3.30	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description
1	A151 (S)	
2	Site access	
3	A151 (N)	
4	Halbeach West access	

Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	I' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
1	4.30	5.71	37.8	17.8	54.2	27.0	
2	4.73	7.25	27.8	21.8	54.2	32.0	
3	4.10	8.87	25.0	21.5	54.2	36.0	
4	4.20	5.77	9.0	17.4	54.2	23.0	

Slope / Intercept / Capacity

Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
1	0.588	1693
2	0.356	2030
3	0.307	1829
4	0.578	1604

The slope and intercept shown above include any corrections and adjustments.

Traffic flows - 2036 WD , PM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.

Analysis Set Details

ID	Name	Network flow scaling factor (%)
A1	Traffic flows	100.000

Traffic flows - 2023 Observed, AM

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	A151 - Frontier Agriculture	T-Junction	Two-way		0.01	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description	Arm type
A	A151 (S)		Major
B	Frontier Agriculture		Minor
C	A151 (N)		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C	9.68			150.0	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Width at give-way (m)	Width at 5m (m)	Width at 10m (m)	Width at 15m (m)	Width at 20m (m)	Estimate flare length	Flare length (PCU)	Visibility to left (m)	Visibility to right (m)
B	One lane plus flare	10.00	9.31	6.34	5.15	4.81	✓	3.00	58	45

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Junction	Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
1	B-A	548	0.084	0.212	0.133	0.303
1	B-C	389	0.089	0.224	-	-
1	C-B	661	0.215	0.215	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Arm 3	2.5	6.22	0.72	2.0	5.01	0.67

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 2 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
